/note="Vector: PWD42nr; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared bin high molar excess. The
polynuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil 4732114 gb| AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse sund annealed to

Novel RNA aptamers that selectively bind coagulation pathway factors, E2 family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Angl or Ang2 activity in a mammal.

Claim 14; Page 25; 216pp; English.

The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) angiopoietin-1 (Angi) or Ang2, respectively, where (I), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F family member, or Ang1 or Ang2 of about 20 nM or less. (I), (II) and (III) have cardiant and cyrostatic activities. (I) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The bloughtain activity of the coaguants printing for treating cardiovascular diseases in the mammal. (II) are useful for treating cardiovascular diseases in the mammal. (II) are useful for modulating E2F activity in a warm-blooded vertebrate. (II) are useful for modulating anticoagulants and significantly delay the clotting time of normal human plasma or the activation of platelets in response to thrombin. (II) are useful for inhibiting call proliferation in a number of conditions e.g., intimal hyperplasia following bypass graft surgery. (III) are useful for creasarch and therapeuric context. The aptamers are useful for diagnostic research and therapeuric context. The aptamers are useful for diagnostic research and therapeuric context. The aptamers are useful so diagnostic research and therapeuric context. The aptamers are useful as diagnostic research and therapeuric context. The aptamers to which they complete the presence or absence of target substances to which they specifically bind, and for identifying substances to which they bind, and as a separation reagent for retrieving the targets to which they continually bind. AbN88488 to ABN88713 and ABB81231 represent to sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method for altering the affinity of a nucleic acid ligand (e.g. an aptamer) for a target molecule in a patient or in vitro, or reversing the binding of the labelled ligand to a target tissue. The method comprises administering a modulator that binds to the ligand to a patient receiving the ligand, or contacting the ligand with the modulator under conditions such that the modulator binds to the ligand, and thus alters the affinity of the ligand for the target molecule. The method is useful for treating a number of disorders e.g. infection, autoimmunity, tumours, inflammatory proliferative diseases and hypoglycamia. The present sequence is a nuclease-resistant 2'-fluoro pyrimidine-modified aptamer to human coagulation Factor IXa (FIXa aptamer), which was used to illustrate the method of the invention
                                                                                                                                                              Altering affinity of nucleic acid ligands for target molecules in a patient or reversing binding of labeled ligands to target tissues, by administering (to a patient receiving the ligand) a modulator that binds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention relates to a method for altering the affinity of a nucleic acid ligand (e.g. an aptamer) for a target molecule in a patient or in vitro, or reversing the binding of the labelled ligand to a target tissue. The method comprises administering a medulator that binds to the ligand to a patient receiving the ligand, or contacting the ligand with the modulator under conditions such that the modulator binds to the ligand, and thus alters the affinity of the ligand for the target molecule. The method is useful for treating a number of disorders e.g. infection, autoimmunity, tumours, inflammatory proliferative diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel RNA aptamers that selectively bind coagulation pathway factors, E2F family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Angl or Ang2 activity in a mammal.
                                                                                                                                                                                                                                                                                                                                                         hypoglycaemia. The present sequence is an aptamer to human coagulation
Factor IXa (FIXa aptamer), which was used to illustrate the method of the
                                                                                            Altering affinity of nucleic acid ligands for target molecules in a patient or reversing binding of labeled ligands to target tissues, by administering (to a patient receiving the ligand) a modulator that binds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RNA aptamer; identification; coagulation factor; angiopoietin; thrombin; E2F family; cardiant; cytostatic; cardiovascular disease; anticoagulant; cell proliferation; intimal hyperplasia; angiogenesis; bypass graft surgery; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                    The present invention relates to a method for altering the affinity of a nucleic acid ligand (e.g. an aptamer) for a target molecule in a patient or in vitro, or reversing the binding of the labelled ligand to a target tissue. The method comprises administering a modulator that binds to the ligand to a patient receiving the ligand, or contacting the ligand with the modulator under conditions such that the modulator binds to the ligand, and thus alters the affinity of the ligand for the target molecule. The method is useful for treating a number of disorders e.g. inflection, autoimmunity, tumours, inflammatory proliferative diseases and hypoglycaemia. The present sequence is an aptamer which was used to illustrate the method of the invention
                                                                                                                          Altering affinity of nucleic acid ligands for target molecules in a. patient or reversing binding of labeled ligands to target tissues, by administering (to a patient receiving the ligand) a modulator that binds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes RNA aptamers (I,II) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) angloopietin-I (Angl) or Ang2, respectively, where (I), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F family cardiant and cytostatic activities. (I) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-coagulation activity of the coagulation pathway factor in the warm-blooded vertebrate (I) are useful for modulating E2F cardiovascular diseases in the mammal. (II) are useful for modulating E2F cardiovascular diseases in the mammal. (II) are useful for modulating E2F cardiovascular and significantly delay the clotting time of normal human plasma or the activation of platelets in response to thrombin. (II) are useful for inhibiting cell proliferation in a number of conditions e.g., intimal hyperplasia following bypass graft surgery. (III) are useful for modulating angiogenesis. The RNA aptamers are also useful for diagnostic modulating angiogenesis. The RNA aptamers are useful as diagnostic creagents to detect the presence or absence of target substances to which they complicially bind, and for identifying substances to which they specifically bind. Ann88488 to absence of targets to which they specifically bind. Ann88488 to Anna to a respect to which they was sequences used in the exemplification of the present invention

The present invention relates to a method for altering the affinity of a nucleic acid ligand (e.g. an aptamer) for a target molecule in a patient or in vitro, or reversing the binding of the labelled ligand to a target tissue. The method comprises administering a modulator that binds to the ligand to a patient receiving the ligand, or contacting the ligand with the modulator under conditions such that the modulator binds to the ligand, and thus alters the affinity of the ligand for the target molecule. The method is useful for treating a number of disorders e.g. infection, autoimmunity, tumours, inflammatory proliferative diseases and hypodyvaemia. The present sequence is an oligonouteotide modulator, which targets the FIXa aptamers 9.3t and 9.3t-3NT. The FIXa aptamers bind to human coagulation Factor IXa and were used to illustrate the method of the invention. This oligonoutleotide was found to be effective at reversing FIXa aptamer's anticoagulation activity in human plasma in
Altering affinity of nucleic acid ligands for target molecules in a patient or reversing binding of labeled ligands to target tissues, by administering (to a patient receiving the ligand) a modulator that binds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               numan; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is one of a large number of 5' ESTs derived from

identified within the present sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTS are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length CDNAs and genomic DNAs. 5' ESTS are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
   mRNAs encoding secreted proteins. No ORF has yet been conclusively
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 77 BP; 31 A; 16 C; 14 G; 16 T; 0 U; 0 Other;

Biochip containing probes complementary with open reading frames in Escherichia coli K12, useful for detecting gene expression and expression patterns.

Claim 3; Page 1697; 2004pp; German.

This invention describes a novel blochip comprising probe spots, each containing many identical probes. The probes are nucleotide sequences of 30-80 bases, are prepared ex situ from synthetic oligonucleotides and at least cone includes a segment of at least 20 bases identical with or complementary to, a segment of an least 20 bases identical with or complementary to, a segment of an open reading frame (orf) of Escherichia (orl K12 and for determining the gene expression pattern, e.g. for in X12 and for determining the gene expression pattern, e.g. for diagnostic determine the effects of e.g. growth media on gene expression. The blochip provides as comprehensive as possible detection of the K12 genome, with simultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or other E. coli strains in a single experiment. Apart from qualitative and quantitative information about gene expression, it also allows

```

measurements of population densities for the various strains. The use of synthetic oligonuclectides for preparation of probes allows free variation in probe length and ensures high purity (and thus selectivity, reactivity and reproducibility); also synthetic probes are generally shorter than probes prepared by polymerase chain reaction. ACD68731 to ACD81540 represent oligonucleotide probes used with the biochip described
                                                                                                                                                                                                                                                        Gaps

comprising an immunogenic portion of a lung tumor protein or variant (P2) which have eytoetatic activity. The polypeptides and polynucleotides are used in compositions and vaccines to inhibit the development of cancer, especially lung cancer, in a patient. Methods described in the invention dan be used to monitor the progression of a cancer by carrying out the detection at subsequent time points and comparing the results from the different time points. CD4+ and/or CD8+ T-Cells isolated from a patient ear treated with P2, polynucleotides encoding P2 or antigen presenting development of cancer. Isolated polypeptide comprising an immunogenic portion of a lung tumor protein is used for detecting and monitoring progression of lung cancer This invention describes a novel isolated polypeptide (I) which Claim la; Page 233; 261pp; English. in a patient.

The present invention describes isolated human lung carcinoma polymucleotides (I) and polypeptides (II). (I) and (II) have cytostatic activity, and can be used in gene therapy and in vaccines. Compositions comprising (I) or (II) can be used for stimulating an immune response in a patient and for treating lung cancer in a patient. Oligonucleotides of (I) can be used for detecting the presence of a cancer in a patient, by obtaining a biological sample from the patient, contacting the biological sample from the patient, contacting the biological sample with the oligonucleotide, detecting in the sample, an amount of polymucleotide that hybridises to the oligonucleotide and comparing the amount of polymucleotide that hybridises to the oligonucleotide to a predetermined cut-off value, and determining the presence of a cancer in the patient. (I) and (II) are useful in pharmaccutical compositions, e.g. vaccines. (I) is useful as a marker to indicate the presence or absence of a cancer such as lung cancer. ABO22145 to ABO22486 and ABPG1866 to ABPG1952 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel lung carcinoma polynucleotide sequences and polypeptides encoded by the polynucleotides, useful in pharmaceutical compositions such as vaccines and as markers to indicate the presence of lung cancer.

Human lung activaties, and can be used in vaccine production. Compositions comprising the lung tumour proteins, proteins, proteins, proteins, polynucleotides, antibodies, proteins, proteins, proteins, or antigen presenting cells that express the lung tumour proteins are useful for treating lung cancer or stimulating an immune response. ABL49359 to ABL49300 and ABB77946 to ABB75070 represent sequences used in the exemplification of the present

The present invention relates to a method for altering the affinity of a nucleic acid ligand (e.g. an aptamer) for a target molecule in a patient or in vitro, or reversing the binding of the labelled ligand to a target tissue. The method comprises administering a modulator that binds to the ligand to a patient receiving the ligand, or contacting the ligand with the modulator under conditions such that the modulator binds to the ligand, and thus alters the affinity of the ligand for the target molecule. The method is useful for treating a number of diseases e.g. inflection, autoimmunity, tumours, inflammatory proliferative diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Altering affinity of nucleic acid ligands for target molecules in a patient or reversing binding of labeled ligands to target tissues, by administering (to a patient receiving the ligand) a modulator that binds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hypoglycaemia. The present sequence is an oligonucleotide modulator, which targets FIXa aptamer 9.3t. FIXa aptamer binds to human coagulation
                                                                                                                                                                                                                                                                                                                                             /mod_base= OTHER
/note= "All nucleotides are 2'Omethyl oligonucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Factor IXa and was used to illustrate the method of the invention
                                                                                                                                               Immunosuppressive, aptamer, infection, autoimmunity, tumoi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              222252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes isolated polynucleotides and polypeptides useful for diagnosing, preventing and/or treating cancer, particularly lung cancer. A new isolated polynucleotide comprises: any of the 22 fully defined nucleotide sequences (e.g. 1012, 900 or 2773 bp) given in the specification; complements of the nucleotide sequences cited above; at least 10 contiguous residues of the nucleotide sequences cited above; at sequence that hybridise to any of the nucleotide sequences under highly stringent conditions; a sequence that is at least 75 or 90% identical to the above nucleotide sequences. The composition and methods are useful in diagnosing, preventing and/or treating cancer, particularly lung cancer, in gene therapy and in vaccines. This sequence represents a human lung tumour cDNA isolated from a lung squamous cell carcinoma that may be useful in the diagnosis and treatment of lung cancer and other disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ' YAW, Li SX, Kalos MD, Henderson RA;

                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for altering the affinity of a nucleic acid ligand (e.g. an appeamer) for a target molecule in a patient or in vitro, or reversing the binding of the labelled ligand to a target tissue. The method comprises administering a modulator that binds to the ligand to a patient receiving the ligand, or contacting the ligand with the modulator under conditions such that the modulator binds to the ligand, and thus alters the affinity of the ligand for the target molecule. The method is useful for treating a number of disorders e.g. infection, autoimmunity, tumours, inflammantary proliferative diseases and bypoglycaemia. The present sequence is an oligonucleotide modulator, which targets the FIXa aptamers 9.3t and 9.3t.3NT. The FIXA aptamers bind to human coagulation Pactor IXa and were used to illustrate the method of the invention. This oligonucleotide was found to be effective at

The method comprises administering a modulator that binds to the ligand to a patient receiving the ligand, or contacting the ligand with the modulator under conditions such that the modulator binds to the ligand, and thus alters the affinity of the ligand for the target molecule. The method is useful for treating a number of disorders e.g. inflementary, autoimmunity, tumours, inflammatory proliferative diseases and hypoglycaemia. The present sequence is an oligonucleotide modulator, which targets FIXa aptamer 9.3t. FIXa aptamer binds to human coagulation estotorized was used to illustrate the method of the invention. This oligonucleotide was lead to illustrate the method of the invention. This and was used to illustrate the method of the invention. This anticoagulation activity in human plasma in vitro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Altering affinity of nucleic acid ligands for target molecules in a patient or reversing binding of labeled ligands to target tissues, by administering (to a patient receiving the ligand) a modulator that binds
                                                          /note= "All nucleotides are 2'Omethyl oligonucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1, Ap

Patent No. 592558
GENERAL INFORMATION:
APPLICANT: Earle, Steven R.
APPLICANT: Jacobson, Walter E.
TITLE OF INVENTION: Nucleic Acid Primers for Amplification
TITLE OF INVENTION: of a Mycobacteria RNA Template
NUMBER OF SEQUENCES: 16
CORRESPONDENCE ADDRESS:
ADDRESSEE: Akzo No. 5925518el Patent Department
                                                                                                                                                                                                                                                                                                                                                                                                APPLICANT: BANGE, CLAILED S.
APPLICANT: BANGE, MANCY
APPLICANT: Hosken, Mancy
APPLICANT: Hosken, Mancy
APPLICANT: Li, Samuel X.
APPLICANT: Wang, Aijun
APPLICANT: Wang, Aijun
APPLICANT: Wang, Aijun
APPLICANT: MANG, AND METHODS FOR THE THERAPY
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY
TITLE OF INVENTION: AND DIAGNOSIS OF LUNG CANCER
FILE REFRENCE: 210121.455C9
CURRENT APPLICATION NUMBER: US/09/606,421B
CURRENT FILING DATE: 2000-06-28
                                                   Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5: Akzo No. 5925518el Patent Department

Patent No. 6503706

GENERAL INFORMATION:
APPLICANT: ABBEN, Hinrich J
APPLICANT: ANGER, Herbert
ITILE OF INVENTION: METHOD OF IDENTIFYING HUMAN AND ANIMAL
TITLE OF INVENTION: CELLS CAPALE OF UNLIMITED PROLIFERATION OR TUMOR
TITLE OF INVENTION: FORMATION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 46;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Indels
sequence 1, Application US/09486241
patent No. 6472184
GENERAL INFORMATION:
APPLICANT: Hegement Peter
TITLE OF INVENTION: METHOD FOR PRODUCING NUCLEIC ACID
TITLE OF INVENTION: POLYMERS
FILE REFERENCE: 3910/66706
CURRENT APPLICATION NUMBER: US/09/486,241
CURRENT FILING DATE: 2000-02-22
PRIOR FILING DATE: 1996-08-17
PRIOR FILING DATE: 1997-08-17
PRIOR FILING DATE: 1997-08-17
PRIOR FILING DATE: 1997-08-17

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 25,

/done="Organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site l: BamHi; Site 2: BglII;
RescueMu is a 4.9 bb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.iastate.edu' and follow the links for
'RescueMu.' Grid AA was grown at UC San Diego in 2002. DNA
was extracted from leaf strips, double digested using
BamHi and BglII, and ligated to form circular plasmids.
DH10B cells were transformed and then screened on LB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

pBlueScript backbone); Site 1: BamH1; Site 2: BglII; RescueWu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Wu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zamb.iastete.edu' and follow the links for RescueMu.' Grid AA was grown at UC San Diego in 2002. DNA was extracted from leaf strips, double digested using BamH1 and BglII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tel: +55-11-2704922

The library was constructed by Brandi Chiapelli and Dr. James

The library was constructed by Brandi Chiapelli and Dr. James

McGarter at Washington University, St. Louis. The cDNA was made by

using Dynabead oligo-dr priming (Dynal). PCR based library using a

modified protocol from the SNART PCR cDNA Synthesis Kit from

Clontech. Directionally cloned into the UDG sites of pAMP1.

Dissected nematode tissues were provided by Dr. Alan Scott

(ascott@jhaph.edu). of the School of Public Hygene and Public Health

at John Hopkins University in Baltimore, MD.

Seg primer: -40RP from Gibco

High quality sequence stop: 156.

Xhol; Gamete library was constructed by Hui Zhao, Min Lu,
Jeffrey McDermott, William J. Snell and John Davies.
Strain 21gr cells (CC-1690; mething type plus) and strain
6145c cells (CC-1690; mething type plus) and strain
Growing on a light-dark cycle (13:11 L/D) in R-medium
(Sager and Granick) were separately transfered into
nitrogen-free medium at 8 hours into the light period.
PolyA mRNA was purified from each sample every 2 hours for
the next 18 hours. The mRNA was pooled and used for CDNA
synthesis. The CDNA was directionally cloned into lambda
Zap II (Stratagene) in the EcoRI (5:) and XhoRI (3:)
sites. pBluescript II SK- plasmids were excised from the
lambda ZAP clones by superinfection with ExABsiste
(Stratagene) phage. The library was normalized using
method 4 described in Bonaldo et al., (1996) Genome
Research 6: 791-806."

/lab host="E. Coli strain XL10-Gold, Tl-resistant, F-"
/clone_lib="Mouse 10kb plasmid UUGCIM library"
/note="Vector: PWD42nr; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources Adocuments/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|473214|gb|AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli Xii0-Gold (Stratagene) cells
and selected for ampicillin resistance."

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Novel RNA aptamers that selectively bind coagulation pathway factors, B2 family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Angl or Ang2 activity in a mammal.

E2F

Claim 14; Page 25; 216pp; English.

The present invention describes RNA aptamers (1,II,III) that selectively bind: (a) a cosqulation pathway factor; (b) an E2F family member; or (c) angiopoietin-1 (Angl) or Ang2, respectively, where (I), (II), (III) have a dissociation constent for the cosqulation pathway factor, an E2F family member, or Angl or Ang2 of about 20 nM or less (I), (II) and (III) have cardiant and cyrostatic activities. (I) are useful for modulating the biological activity of a cosqulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that

```
the biological activity of the coagulation pathway factor in the warm-blooded vertebrate is modulated. (I) are also useful for treating cardiovascular diseases in the mammal. (II) are useful for modulating E2F activity in a warm-blooded vertebrate. (II) are useful for modulating E2F anticoagulants and significantly delay the clotting time of normal human plasma or the activation of platelets in response to thrombin. (II) are useful for inhibiting cell proliferation in a number of conficions e.g., intimal hyperplasia following bypass graff surgery. (III) are useful for modulating anglogenesis. The RNA aptamers are also useful for diagnostic research and therapeutic context. The aptamers are useful for diagnostic research and therapeutic context. The aptamers are useful as diagnostic research and therapeutic context. The aptamers are useful as diagnostic compactically bind, and for identifying substances to which they becifically bind, for isolating and purifying substances to which they bind, and as a separation reagent for retrieving the targets to which they becifically bind. Anna8488 to ABN88713 and ABBB1231 represent eventual expenses.

                                                   The present invention relates to a method for altering the affinity of a nucleic acid ligand (e.g. an aptamer) for a target molecule in a patient or in vitro, or reversing the binding of the labelled ligand to a target tissue. The method comprises administering a modulator that binds to the the modulator under conditions such that the modulator that binds to the the modulator under conditions such that the modulator binds to the ligand, and thus alters the affinity of the ligand for the target molecule. The method is useful for treating a number of disorders e.g. infection, autoimmunity, tumours, inflammatory proliferative diseases and hypoglycaemia. The present sequence is an aptamer to human coagulation pactor IXa (FIXa aptamer), which was used to illustrate the method of the

                                              The present invention relates to a method for altering the affinity of a nucleic acid ligand (e.g. an aptamer) for a target molecule in a patient or in vitro, or reversing the binding of the labelled ligand to a target tissue. The method comprises administering a modulator that binds to the ligand to a patient receiving the ligand, or contacting the ligand with the modulator under conditions such that the medulator binds to the ligand, and thus alters the affinity of the ligand for the target molecule. The method is useful for treating a number of disorders e.g. infection, autoimmunity, tumours, inflammatory proliferative diseases and hypoglycaemia. The present sequence is an aptamer which was used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an B2F family member; or (c) angiopoletin-1 (Ang1) or Ang2, respectively, where (I), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F family member, or Ang1 or Ang2 of about 20 nM or less. (I), (II) and (III) have cardiant and cytostatic activities. (I) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-blooded vertebrate (i) are also useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel RNA aptamers that selectively bind coagulation pathway factors, E2F family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Angl or Ang2 activity in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RNA aptamerį identification; coagulation factor; angiopoietin; thrombin; E2F family; cardiant; cytostatic; cardiovascular disease; anticoagulant; cell proliferation; intimal hyperplasia; angiogenesis;

cardiovascular diseases in the mammal. (II) are useful for modulating E2F activity in a warm-blooded vertebrate. (III) are useful for modulating Anglor Anglor Anglor in a warm-blooded vertebrate. (I) are potent anticoagulants and significantly delay the clotting time of normal human plasma or the activation of platelets in response to thrombin. (II) are useful for inhibiting call proliferation in a number of conditions e.g., intimal hyperplasia following bypass graft surgery. (III) are useful for inhibiting angiogenesis. The RNA aptamers are also useful for diagnostic, research and therapeutic context. The aptamers are useful for diagnostic research and therapeutic context. The aptamers are useful so diagnostic creagents to detect the presence or absence of target substances to which they specifically bind, and for isolating and purifying substances to which they bind, and as a separation reagent for retrieving the targets to which they bind, and as a separation reagent for retrieving the targets to which they specifically bind. The binding molecule is selected from an antibody free of natural impurities, a monoclonal antibody or a binding fragment of either of these. The method may be used for diagnosing the presence of Alzheimer's disease, neuroectodermal tumours and a malignant astrocytoma in a human. A number of clones of neural thread protein were isolated from healthy 17-18 week old foetal human brain (HB) 2 year old temporal lobe neocortex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection of neural thread protein in diagnosis of Alzheimer's disease - also NTP DNA and protein sequences used in gene and anti:sense therapy.

The present invention describes RNA aptamers (1,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) andyobotein-1 (Angl) or Ang2, respectively, where (1), (II), (III) have a candiopotein-1 (Angl) or Ang2, respectively, where (I), (II) and (III) have a candiant and cytostatic activities. (I) are useful for modulating the cardiant and cytostatic activities. (I) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the biological activity of the coagulation pathway factor in the warm-coagulation activity of the coagulation pathway factor in the warm-coagulation activity of the coagulation pathway factor in the warm-coagulation activity in a warm-blooded vertebrate. (III) are useful for modulating E2F activity in a warm-blooded vertebrate. (III) are useful for modulating anticoagulants and significantly delay the clotting time of normal human plasma or the activation of platelets in response to thrombin. (II) are useful for intimal hyperplasia following bypass graft surgery. (III) are useful for modulating angiogenesis. The RNA aptamers are also useful for diagnostic research and therapeutic context. The aptamers are useful as diagnostic reasarch and therapeutic context. The aptamers are useful as diagnostic reasarch and therapeutic context. The aptamers are useful so which they specifically bind, and for identifying substances to which they specifically bind, for isolating and purifying substances to which they
                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel RNA aptamers that selectively bind coagulation pathway factors, E2F family members, Angl or Ang2, useful for modulating coagulation pathway factor activity, E2F activity and Angl or Ang2 activity in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  aptamer; identification; coagulation factor; angiopoietin; thrombin; family; cardiant; cytostatic; cardiovascular disease; anticoagulant; l proliferation; intimal hyperplasia; angiogenesis;

The polymorphic markers which have been isolated using the primers polymorphic markers which have been isolated using the primers represented in AAX09121-X10268 The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary sphenocytosis, von Willebrand's disease, tuberous sclerosis, hereditary cancemorrhagic telangiscteral, familial colonic polyposis, Bilers-Danios syndrome, osteogenesis imperfects, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous cystem, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid engages of the nervous continuance of segments can also be used to produce medicaments for the treatment or
                                                                                                                                                             ö
bind, and as a separation reagent for retrieving the targets to which they specifically bind. ABN88488 to ABN88713 and ABB81231 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymorphism; biallelic; human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament;

The present sequence is that of the mouse indicolates growin Lactors, true present sequence is that of the mouse indication factor binding motifs ADE35058-ADE35060 from FGF-4 promoters have been shown to direct stem cell specific expression. This discovery was exploited in methods of the invention for manipulating the phenotype of a stem cell. In such a method, a cell is transfected with a mucleic acid molecule that includes the promoter which comprises a motif that confers stem cell specific expression on a selectable marker (e.g. fluorescent protein or produce cativating polypeptide) gene, and conditions conducive to proliferation of the cell are provided. A cell culture system is provided which facilitates the maintenance of stem cells, particularly embryonic stem cells, in an undifferentiated state. Also provided are differentiated cells and tissues, the genome of which includes a nucleic acid construct comprising a promoter which has a stem cell specific expression pattern which has a stem cell specific expression pattern comprising a promoter which have de-differentiated to a stem cell conferned cells. The stem cells are hammatopoletic, neural, bone, muscle, mesenchymal, trophoblastic, epithalial, endodermal or embryonic confermation of cells (including embryonal carcinoma TERA2 or NTERA2 cells), or manipulation of cells (including embryonal carcinoma TERA2 or NTERA2 cells), or

The present sequence is that of the mouse fibroblast growth factor-3 (FGF -4) promoter from nucleotides -64 to +116. Transcription factor binding motifs ADE35058ADE35060 from FGF-4 promoters have been shown to direct stem cell specific expression. This discovery was exploited in methods of the invention for manipulating the phenotype of a stem cell. In such a method, a cell is transfected with a nucleic acid molecule that includes a promoter which comprises a motif that confers stem cell specific expression on a selectable marker (e.g. fluorescent protein or prodrug control propeptide) gene, and conditions conductve to profiferation of the cell are provided. A cell culture system is provided which cells; in an undifferentiated state. Also provided are differentiated confiring the genome of which includes a nucleic acid construct comprising a promoter which has a stem cell specific expression pattern which has a stem cell specific expression pattern which has estem cell specific expression pattern which have de-differentiated to a stem cell chance, thereby allowing their removal from a population of a memory of a differentiated cells. The stem cells are haemstoppietic, neural, bone, contain a contain contains the contains contains the contains 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Manipulating phenotype of stem cell by providing cell transfected with nucleic acid comprising promoter which confers substantial stem cell specific expression on selective marker gene(s), and proliferating cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    muscle, mesenchymal, trophoblastic, epithelial, endodermal or embryonic stem cells (including embryonal carcinoma TERA2 or NTERA2 cells), or

The present invention relates to a method for altering the affinity of a nucleic acid ligand (e.g. an aptamer) for a target molecule in a patient or in vitro, or reversing the binding of the labelled ligand to a target tissue. The method comprises administering a modulator that binds to the ligand to a patient receiving the ligand, or contacting the ligand with the modulator under conditions such that the modulator binds to the ligand, and thus alters the affinity of the ligand for the target molecule. The method is useful for treating a number of disorders e.g. infection, autoimmunity, tumours, inflammatory proliferative diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hypoglycaemia. The present sequence is an aptamer to human coagulation Factor IXa (FIXa aptamer), which was used to illustrate the method of the

```
The present invention describes RNA aptamers (I,II,III) that selectively bind: (a) a coagulation pathway factor; (b) an E2F family member; or (c) angiopoletin-I (Angi) or Angi, respectively, where (I), (II), (III) have a dissociation constant for the coagulation pathway factor, an E2F family member, or Angi or Angi of about 20 nM or less. (I), (II) and (III) have cardiant and cytostatic activities. (I) are useful for modulating the biological activity of a coagulation pathway factor which involves administering (I) to a warm-blooded vertebrate (e.g., a mammal) such that the blooded vertebrate is modulated. (I) are useful for reading cardiovascular diseases in the mammal. (II) are useful for reading cardiovascular diseases in the mammal. (II) are useful for modulating and significantly delay the clotting time of normal human cartivity in a warm-blooded vertebrate. (II) are potent anticoagulants and significantly delay the clotting time of normal human cartivity in a varm-blooded vertebrate. (II) are spotent context on the activation of platelets in response to thrombin. (II) are useful for inhibiting cell proliferation in a number of conditions e.g., intimal hyperplasia following bypass graft surgery. (III) are useful for modulating angiogenesis. The RNA aptamers are also useful for diagnostic research and therapeutic context. The aptamers are useful as diagnostic reagents to detect the presence or absence of target substances to which they specifically bind, and for identifying substances to which they specifically bind, ABN8488 to ABN89713 and ABBS121 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                                                                                                                               17; leukocyte; gene expression profiling; allograft rejection;
atherosclerosis; congestive heart failure; systemic lupus erythematosus;
rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wohlgemuth J, Fry K, Matcuk G, Altman P, Prentice J, Phillips J; Ly N, Woodward R, Quertermous T, Johnson F;
                                                                                                                   Human leukocyte gene expression profiling probe SEQ ID NO 1519.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  54.5%; Score 15.8; DB 6; Length 50; 63.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to novel murine cDNAs produced using gene trap technology. The OWNIRANK gene trapped sequences (GTSS) are individually identified novel genes, and are useful in functional genomic analysis, in the discovery and development of new therapeutic and disgnostic agents, for gene discovery, for diagnostic gene expression analysis, for cross species hybridisation analysis, and for genetic manipulations such as antisense inhibition or gene targeting. The polynucleotides of the invention are also useful for isolating cDNAs, genomic clones or full-length genes/polynucleotides, or their homologues, centerologues, paralogues or orthologues, that are capable of hybridising to one or more of the new murine polynucleotide sequences. The polynucleotides are also useful for identifying the coding regions of the murine genome, and as hybridisation probes. ABX90657-ABX91682 represent the murine GTSs of the invention. Noce: The sequence data for this patent coding to the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                       The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a CA nucleic acid a polypeptide (especially an antibody) that specifically hinds to the protein, and a biochip comprising CA nucleic acid or fragments thereof. The sequences of the invention were identified using oncogenic retroviruses, which insert into the genome of the host organism at random. Many of these do not carry transduced host oncogenes or pathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host protonnosquence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Carcinoma (especially breast cancer, prostate cancer, lymphom or leukaemia) or a propensity to carcinoma by determination of the sequence of a CA gene, or by determination of CA gene expression in particular tissues. CA nucleic acids, proteins and antibodies are also useful as therapeutic agents and in screening and evaluating drug candidates. The sequence of the invention. Note: The sequence data for unless caid also available in electronic format from WIPO at

The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined in the specification. A polynucleotide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypeptides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and sarcomas. The sequences shown in ADB71221-ADB72172 represent mouse sequence tags, or genomic insertion sites, of carcinoma associated (CA) genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant nucleic acid, useful for treating carcinomas, lymphomas,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
